VIDYA NAGAR, PALISSERY, KARUKUTTY ERNAKULAM – 683 582 MAY 2022

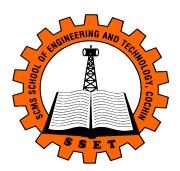

DECLARATION

I undersigned hereby declare that the project report Feature Extraction and Experimental Investigation of Clickbait in YouTube Videos, submitted for partial fulfilment of the requirements for the award of degree of Master of Technology of the APJ Abdul Kalam Technological University, Kerala is a bonafide work done by me under supervision of Ms. Nisha S Raj, Assistant Professor, Department of Computer Science and Engineering, SCMS SCHOOL OF ENGINEERING AND TECHNOLOGY, Karukutty, Ernakulum. This submission represents my ideas in my own words and where ideas or words of others have been included, I have adequately and accurately cited and referenced the original sources. I also declare that I have adhered to ethics of academic honesty and integrity and have not misrepresented or fabricated any data or idea or fact or source in my submission. I understand that any violation of the above will be a cause for disciplinary action by the institute and/or the University and can also evoke penal action from the sources which have thus not been properly cited or from whom proper permission has not been obtained. This report has not been previously formed the basis for the award of any degree, diploma or similar title of any other University.

CERTIFICATE

This is to certify that the report entitled "Feature Extraction and Experimental Investigation of Clickbait in YouTube Videos" submitted by Nithin P (SCM18CS052), Sharath K Nambiar (SCM18CS069), Shehzad Ibrahim (SCM18CS070), Yedukrishna J (SCM18CS085) to the APJ Abdul Kalam Technological University in partial fulfillment of the requirements for the award of the Degree of Bachelor of Technology in DEPARTMENT OF COMPUTER SCIENCE AND ENGINEERING, SCMS SCHOOL OF ENGINEERING AND TECHNOLOGY VIDYA NAGAR, PALISSERY, KARUKUTTY ERNAKULAM is a bonafide record of the project work carried out by him/her under my/our guidance and supervision. This report in any form has not been submitted to any other University or Institute for any purpose.

Internal Supervisor(s)

External Supervisor (if any)

ACKNOWLEDGEMNT

We are greatly indebted to Dr. Praveensal C J, Principal, SCMS SCHOOL OF ENGINEERING AND TECHNOLOGY, Karukutty, Ernakulam and Dr. Varun G Menon, Head of Department, Department of Computer Science and Engineering, SCMS SCHOOL OF ENGINEERING AND TECHNOLOGY, Karukutty, Ernakulam who whole heartedly permitted me to conduct this seminar.

I would like to thank my guide, Ms. Nisha S Raj, Assistant Professor, Department of Computer Science and Engineering, SCMS SCHOOL OF ENGINEERING AND TECHNOLOGY, Karukutty, Ernakulam who has given me valuable guidance and support throughout the seminar. Also, I would like to thank my seminar coordinator, Mrs. Josna Philomina, Assistant Professor, Department of Computer Science and Engineering SCMS SCHOOL OF ENGINEERING AND TECHNOLOGY, Karukutty, Ernakulam, who supported and instructed me all the way.

I would like to express my sincere gratitude to all the teachers of the Computer Science Department who gave us moral and technical support. I would like to thank the supporting staff in the computer lab whose dedicated work kept the lab working smoothly, thus enabling me to have access to various resources which helped me understand more about the seminar topic. I would also like to thank my friends and family members for providing me with the necessary resources and support. Last but not least I like to thank God Almighty for helping me to conduct the seminar hassle-free.

ABSTRACT

Social media sites such as Twitter, Facebook, and YouTube make it easy for users to express their thoughts, due to this lot of inaccurate and unreliable audio-visual information is frequently produced and shared through these channels.

YouTube is one of the most popular video-sharing platforms, with billions of users accounting for about one-third of the internet population. As a result, it is rife with videos that do not accurately depict the situation that it refers to.

The titles and thumbnails of these videos are purposely designed to attract the user's attention and make them curious to follow the link and read, view, or listen to the attached content. Such videos are called Clickbait Videos.

The aim is to detect these clickbait YouTube Videos using multiple evidences that is selected from its metadata.

CHAPTER 1

INTRODUCTION

1.1 GENERAL BACKGROUND

In the internet era that we're living in, YouTube doesn't actually require a formal introduction. YouTube is so popular that it's almost impossible to find a person who doesn't know about it. It covers a wide range of applications from tutorials about millions of topics to entertainment. It's possible to say that YouTube can easily claim that no other app has attained such a high level of scope. It has such an influence on people that, it's not possible for a person to spend a day without it. The wide horizon of success is due to the fact that it doesn't inflict any financial cost to the viewers nor the content publishers. The platform provides freedom to the content creators without imposing any regulations to the legitimacy of the content. It also offers monetary profits to the content publishers or the channel admin, as we say in technical terms according to the viewership and the support a video gets. The support or viewership of a video can easily be boosted by sharing a link of the video further increasing the income earned by a video publisher. Thus, content creators started creating misleading but attractive contents to gain more viewership. The users use various parameters like thumbnail, description, title etc. to decide whether to watch the video or not. Content creators increase their view count by posting videos with thumbnails which do not match their content but potentially attract a wide range of audience. Clickbait videos are infecting the internet in a daily wide spread basis. Users get confused about the reality of facts and are misled into lies they're made to believe. This creates a toxic environment in the internet. A system is needed for the detection of such clickbait videos.

YouTube removed the public dislike count from all its videos in November 2021. While creators can still see the number of dislikes they received for their video,

viewers can only see the number of likes. This created a hole in the existing clickbait detection system with the number of dislikes being removed. Like to dislike ratio was the most promising parameter when it comes to detecting whether the video is a clickbait or not. This research thus focuses on finding the best and most accurate parameter from view-like ratio, comments, description and title. The research also focuses on the detection of clickbait with the absence of dislike count using conventional machine learning approaches like KNN, Decision Tree, LSTM, Sentimental Analysis and Logistic Regression. The dataset used for training and testing the algorithms was constructed from the scratch containing a list of 500 videos with all its necessary parameters.

1.2 OBJECTIVE

The objectives of this research are to

- a) Find out the accuracy, precision and recall of each parameter and determine the best replacement for dislike.
- b) Make a dataset containing 500 YouTube videos
- c) Use the most accurate parameters and dataset to train and test KNN, naïve bayes, decision tree, LSTM, Sentimental Analysis and Logistic Regression.

CHAPTER 2

LITERATURE SURVEY

2.1 Clickbait detection

This paper proposes a new model for the detection of clickbait, i.e., short messages that lure readers to click a link. Clickbait is primarily used by online content publishers to increase their readership, whereas its automatic detection will give readers a way of filtering their news stream. The first clickbait corpus of 2992 Twitter tweets is compiled, 767 of which are clickbait, and, by developing a clickbait model based on 215 features that enables a random forest classifier to achieve 0.79 ROC-AUC at 0.76 precision and 0.76 recall.

2.2 Relationship between game theory and clickbait

Clickbait media is thought to be created through social media platforms' algorithmic curation. Despite the fact that clickbait can be risky, especially for heritage news organisations, it is widely used. The provision of clickbait is seen as a revised game with an arbitrary limit. It is observed that the behaviour of 37 German legacy news providers following algorithm changes using machine learning and analysis of Facebook posts and Twitter messages over 54 months. The findings show that clickbait is used infrequently, with few heavier-using sources, and that clickbait performance has a reversed U-shaped relationship, with the quantity of clickbait and the number of people engaging form a U-shaped relationship in reverse. News organisations as a whole adjust to an industry-wide clickbait standard. While it is not possible to prove that algorithmic curation generates clickbait, it can be shown that Facebook's regulatory involvement to reduce clickbait disperses uneven supply trends. It can contribute to a better

understanding of editorial decision making in competitive situations that are subject to platform regulation.

2.3 Stylized Headline Generation.

Clickbaits are enticing social media postings or spectacular headlines designed to entice readers to click on them. Clickbait is all over social media, and it can have serious consequences for both consumers and the media industry. To address this difficulty, we suggest using recent advances in deep generative models to build synthetic headlines with specified styles and investigate their use in improving clickbait identification. The authors suggest, in particular, using style transfer to generate styled headlines from original papers. Furthermore, because generating stylized headlines is difficult due to issues such as the discrete nature of texts and the need to preserve the document's semantic meaning while achieving style transfer, proposed a novel solution called Stylized Headline Generation (SHG) that can not only generate readable and realistic headlines to enlarge original training data, but also aids supervised learning's classification capacity. SHG's success in generating high-quality and high-utility headlines for clickbait detection is demonstrated by experimental findings on real-world datasets.

2.4 OVCP

Online video sharing services (such as YouTube and Vimeo) have become a popular way for individuals to view video content. On internet video sharing platforms, clickbait video, whose substance plainly deviates from its title/thumbnail, has developed as a major issue. Current clickbait detection systems that primarily rely on evaluating the title text, thumbnail image, or video content have been demonstrated to be ineffective in detecting online clickbait videos. In this research, the authors present Online Video Clickbait Protector (OVCP), and unique

content-agnostic approach for detecting clickbait films by examining the comments left by the audience that watched the video. OVCP, unlike other systems, does not directly evaluate the video's content and pre-click information but instead, goes through the different features that can be extracted from the different comments that are left by different users who have watched the video and, in the end, using these features we finally classify the video as Clickbait or not.

2.5 Identifying Clickbait Posts on social media with an Ensemble of Linear Models

Making a link so alluring that people click on it is the goal of clickbait. However, the content of such publications frequently has little to do with the title, exhibits poor quality, and ultimately dissatisfies the reader. The creators of the clickbait challenge (http://www.clickbait-challenge.org/) invited the participants to create a machine learning model for grading articles based on their "clickbaitness" in order to benefit the readers. The strategy was successfully evaluated in the challenge, where it demonstrated excellent performance of 0.036 MSE and placed third out of all the solutions to the challenge. In this research, they proposed to address the clickbait problem with an ensemble of Linear SVM models.

2.6 Machine Learning Based Detection of Clickbait Posts in Social Media

In this study, a dataset containing over 21,000 headlines and titles from the 2017 Clickbait Challenge (clickbait-challenge.com), each of which is annotated with at least five crowdsourced assessments of its clickbaitness. Develop a reliable computational clickbait detection model. For our final model, we chose the 60 most crucial features out of a total of 331 features after filtering out many features to prevent overfitting and speed up learning. On the clickbait class, Random Forest Regression produced the following findings using these features: MSE=0.035 MSE, Accuracy=0.82, and F1-sore=0.61.

2.7 Clickbait Detection in Tweets Using Self-Attentive Network

A model which is capable of evaluating each tweet's level of click baiting. We first reformat the regression problem as a multi-classification problem, based on the annotation scheme. To perform multi-classification, we apply a token-level, self-attentive mechanism on the hidden states of bi-directional Gated Recurrent Units (biGRU), which enables the model to generate tweets' task-specific vector representations by attending to important tokens. The self-attentive neural network can be trained end-to-end, without involving any manual feature engineering.

2.8 Towards a Regression Model for Clickbait Strength

Malicious content publishers misuse social media to manipulate as many users as possible to visit their websites using clickbait messages. Machine learning technology may help to handle this problem, giving rise to automatic clickbait detection. To accelerate progress in this direction, they organized the Clickbait Challenge 2017, a shared task inviting the submission of clickbait detectors for a comparative evaluation. A total of 13 detectors have been submitted, achieving significant improvements over the previous state of the art in terms of detection performance. Also, many of the submitted approaches have been published open source, rendering them reproducible, and a good starting point for newcomers.

2.9 Detecting Clickbait in Online Social Media

This paper proposes a machine learning approach to detect clickbait posts published in social media. Clickbait posts are short, catchy phrases pointing into a longer online article. Users are encouraged to click on these posts to read the full article in many cases. The suggested approach differentiates between clickbait and legitimate posts based on training mainstream machine learning (ML) classifiers.

2.10 Detecting and preventing clickbaits in online news media

In this work, they attempt to automatically detect clickbait videos and then build a browser extension which warns the readers of different media sites about the possibility of being baited by such headlines. The extension also offers each reader an option to block clickbaits she doesn't want to see. Then, using such reader choices, the extension automatically blocks similar clickbaits during her future visits.

CHAPTER 3

METHODOLOGY

3.1. Data Collection

Our dataset consists of 500 videos (Clickbait, Non-Clickbait) gathered from YouTube. In this section, it is explained how clickbait videos are causing a problem for the audience on YouTube. Then, it is explained how the platform and publisher selection is made for the dataset, and the necessary details about these publishers are presented. Finally, it is explained how data is extracted from this platform and pre-processed for the analysis.

3.1.1. Platform Selection

YouTube is the leading platform that is plagued with videos that don't faithfully represent the situation that it refers to. The user has to add a title, a description, and a thumbnail before uploading a video. These data become crucial parameters on which the users can base their decision to watch a video or not. Many YouTube content creators use clickbait titles and thumbnails that might deviate from the actual content to increase viewership for a video, and generate more revenue. The freedom in creating content gives an incentive for people to post clickbait videos, in which the content might deviate significantly from the title, description, or thumbnail.

3.2. Dataset Construction

We built two datasets. Our first dataset consists of details of 500 videos (Clickbait, Non-Clickbait) gathered from YouTube. The data was collected using a program which extracts videos based on certain keywords. The Google Sheet programming environment was used to code the program that extracts this video details. The keywords we used were top clickbait words like '10 Reasons Why', 'Wow', 'Amazing', 'No Way' etc. The program uses YouTube Data API v3 as a Library and uses it to scrape and analyse videos relating to this query. We extracted 30 first hit videos of each clickbait keyword. The extracted video details include: Title, YouTube Link, Channel ID, Description, Tags, View Count, Like Count, Favourite Count and Comment Count. To get certain details like Video Length, Category ID and Channel Verification we used the website mattw.io which extracts every Metadata detail of the a given video.

The second database consists of all the comments of the videos which are present in the Metadata Dataset. The Comments of these YouTube Videos were extracted using the YouTube Data API v3 using the Google Sheet Programming platform. The program accepts the Video ID as input and it outputs all the Comments extracted from the video into the Google Sheet. The extracted details include: Video ID, Comment, number of likes, number of replies. Extracted comments of 500 Videos which consists of nearly 10 lakhs of rows of data.

3.2.1. Dataset Validation

In order to evaluate the accuracy of labelling the headlines in the dataset as clickbait and non-clickbait, we examined the video thumbnail and the video content. This information coming from humans is essential because it was used for validating the labels of the dataset and validating the results of the machine learning models. A column was constructed labelled as Clickbait/Non-Clickbait in the Metadata Dataset.

We also found new factors for classification View Like ratio, View Comment Ratio using the Like, View and Comment columns. We found that for majority of the videos if the View Like Ratio was above a value of 126 then the chance that the video is a clickbait was very high. This was used as another column of Clickbait/Non-Clickbait classification using Metadata details.

3.3. Data Analysis

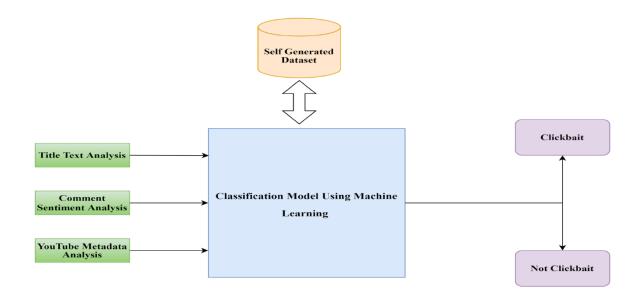

Fig. 3.1

The model we constructs uses three factors for classification of the video as either a Clickbait or a Non- Clickbait. The first factor is the Title Text Analysis which includes scanning and analysing the title text of the YouTube Video.

The second factor is Comment Sentiment Analysis. It includes Sentiment Analysis of every video comments and coming to a conclusion of whether a video comment is mostly positive negative or neutral.

The third factor is the Metadata Details. Metadata is a set of data that describes and gives information about other data. It includes values like View count, Like count and Comment Count. These were analysed and different conclusions were extracted.

3.3.1. Feature Selection

Due to the removal of Dislike count from YouTube videos, it is required to develop a model based on other features. Our aim is to find some of the other features which can effectively detect clickbait videos on YouTube.

3.3.1.1 Title Text Analysis

The title of the videos was subjected to text analysis and categorised based on misleading titles. Developed a classification model using Naive Bayes Algorithm and LSTM and Trained using self-built Dataset which classifies videos based on the title. In the pre-processing stage the title of the YouTube video was converted to tokens. The data is tokenized i.e., split into tokens which are the smallest or minimal meaningful units. The data is split into words. This is then converted into lowercase to avoid ambiguity between same words in different cases like 'NLP', 'nlp' or 'Nlp'. The punctuations are removed to increase the efficiency of the model. They are irrelevant because they provide no added information. Lemmatization in linguistics is the process of grouping together the inflected

forms of a word so they can be analysed as a single item, identified by the word's lemma, or dictionary form. It involves the morphological analysis of words. In lemmatization we find the root word or base form of the word rather than just clipping some characters from the end e.g., *is, are, am* are all converted to its base form *be* in Lemmatization. Here lemmatization is done using NLTK library. Term frequency-Inverse Data Frequency method is used to convert the text into features. The pre-processed data is then trained using Naive Bayes and LSTM and the accuracy measures were calculated.

3.3.1.2 YouTube Metadata Analysis

By using view count and like count we derived a parameter called like-view ratio and developed a hypothesis that a clickbait video should have a high like view ratio than a non-clickbait video. Using this hypothesis, we classified videos as clickbait/non-clickbait. We were able to assess its performance by calculating Accuracy, Precision, F1 Score and Recall using Naïve Bayes, K Nearest Neighbour and Decision Tree Algorithm. Different attributes used were Like Count, View Count, Category ID and Comment Count.

3.3.1.3 Comment Sentiment Analysis

Finally, comments of each and every single video in the dataset were extracted using YouTube Data API v3 and we developed an algorithm for Sentiment Analysis which evaluates each comment and classifies them into positive, negative and neutral comments. The algorithm uses the python library TextBlob. It has an inbuilt function that does sentiment analysis on a given input. The program accepts two datasets, one containing video and the other containing comments of the videos, and produces an excel sheet containing the number of positive, negative and neutral comment count of each video. We developed a hypothesis that a video with more positive comments than negative comments are more likely to be not clickbait.

3.3.2. Performance Analysis

In addition to developing machine learning models that can successfully distinguish clickbait sentences from non-clickbait sentences, it is also critical to understand how these models decide and their confidence in their decisions. The explainability of models is essential for understanding the mechanism of the clickbait strategy and its linguistic structure. Examining the results of the models by discretization does not provide an accurate assessment of the performance of the models. In this way, it is not possible to observe which sentences the models call clickbait or non-clickbait with what degree of Certainty.

CHAPTER 4

RESULTS AND DISCUSSIONS

4.1. Title Text Analysis

4.1.1 Naïve Bayes

The Naïve Bayes was an algorithm used on the 500-video dataset in this study. We used 100 videos at first and got an accuracy of 80% and upon increasing the number of videos by 100, we saw a slight change in accuracy. This model performs with a mean accuracy of 69.28%.

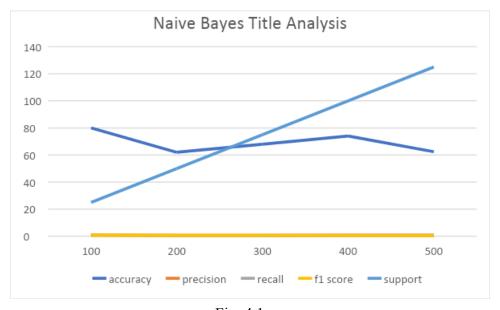

Fig. 4.1

4.1.2 Long Short-Term Memory

The LSTM was developed using a Deep Learning library, Keras. This model was trained with the 500-video dataset as in the previous algorithms, and it performs with a mean accuracy of 66.25%. The performance of the LSTM can be Found in Figure.

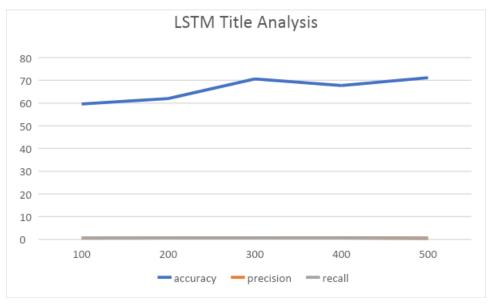

Fig. 4.2

4.2. YouTube Metadata Analysis

4.2.1 Naïve Bayes

The Naïve Bayes was an algorithm used on the 500-video dataset in this study. According to feature importance of this model (Figure 4.3), the number of views, the number of likes, number of comments and category id are distinctive for clickbait detection. We used 100 videos at first and used only the number of views and got an accuracy of 55% and when we combined view count with like count, we got an accuracy of 57.49%. Then we combined view, like and comment count and got an accuracy of 50% and finally combined all parameters and got an accuracy of 60%. Then we increased the number of videos by 100 and obtained the following results.

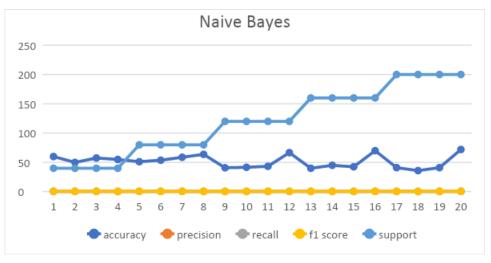

Fig 4.3

4.2.2 Decision Tree

The Decision Tree was an algorithm used on the 500-video dataset in this study. According to feature importance of this model (Figure 4.4), the number of views, the number of likes, number of comments and category id are distinctive for clickbait detection. We used 100 videos at first and used only the number of views and got an accuracy of 50% and when we combined view count with like count, we got an accuracy of 45%. Then we combined view, like and comment count and got an accuracy of 55% and finally combined all parameters and got an accuracy of 60%. Then we increased the number of videos by 100 and obtained the following results.

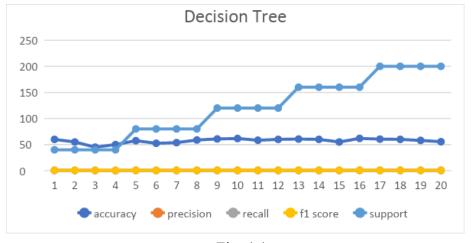

Fig. 4.4

4.2.3 K-Nearest Neighbour

The Naïve Bayes was an algorithm used on the 500-video dataset in this study. According to feature importance of this model (Figure 4.5), the number of views, the number of likes, number of comments and category id are distinctive for clickbait detection. We used 100 videos at first and used only the number of views and got an accuracy of 55% and when we combined view count with like count, we got an accuracy of 52.5%. Then we combined view, like and comment count and got an accuracy of 50% and finally combined all parameters and got an accuracy of 47.55%. Then we increased the number of videos by 100 and obtained the following results.

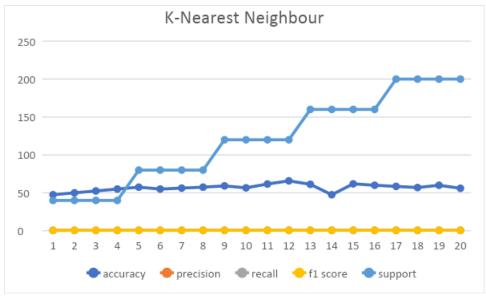

Fig. 4.5

Algorithm Used	Parameters Used	Precision	Recall	F1 Score	Accuracy
Naïve Bayes	View	0.48	0.69	0.57	69.37%
	View, Comment	0.49	0.70	0.58	70.0%
	View, Comment, Category	0.50	0.71	0.58	70.62%
	View, Like	0.57	0.68	0.60	65.17%
	View, Comment, Like, Category	0.42	0.65	0.51	65.0%
Decision Tree	View	0.62	0.62	0.62	62.03%
	View, Like	0.63	0.64	0.63	63.8%
	View, Comment, Category	0.64	0.66	0.65	65.74%
	View, Like, Comment, Category	0.60	0.61	0.60	61.11%

Algorithm Used	Parameters Used	Precision	Recall	F1 Score	Accuracy
K- Nearest Neighbour	View	View 0.49 0.51		0.47	50.92%
	View, Like		0.54	0.53	53.70%
	View, Comment, Category	0.60	0.62	0.61	62.03%
	View, Comment, Like, Category	0.64	0.66	0.65	53.70%

Table 4.1

4.3. Comment Sentiment Analysis

4.3.1. Naïve Bayes

Comment Sentiment Analysis, also known as opinion mining is a powerful tool that can easily be put to work on a large database to automatically understand the emotions behind the comments posted by users. We used Naïve Bayes to perform Comment Sentiment Analysis. Each comment of the videos is evaluated and are classified as negative, positive or neutral on the basis of the certain keywords to analyse the emotion of user behind the comment using an algorithm. The algorithm uses Python Library TextBlob. Two datasets are accepted by the algorithm, one containing video and the other

containing comments of the videos. The output will be an excel sheet containing the number of positive, negative and neutral videos. Classification of clickbait videos is carried out based on the assumption that, If the number of Negative comments is more than the number of Positive comments, the video is possibly a clickbait video. The performance of the algorithm is assessed by using the parameters Accuracy, Precision, Recall and F1 Score.

CHAPTER 5

DISCUSSION AND CONCLUSION

5.1 DISCUSSION

With the increase in accessibility of internet, there was a boom in video streaming platforms like YouTube. With the increase in users all around the globe, the platform started flooding with videos, some of which do not faithfully represent what it is supposed to. The content creator has to add a title, a description, and a thumbnail before uploading a video. These data become crucial parameters on which the users can base their decision to watch a video or not. For assessing the performance of each of the algorithms, we chose Accuracy, F1 Score, Precision and Recall as the parameters. These parameters help in determining how much of the retrieved data is accurately predicted as Clickbait or not using features of a YouTube video like View Count, Like Count, Comment Count, Category ID and a combination of all those features. After training and testing various machine learning algorithms, it was found that the accuracy of View Count, Like Count and Category ID was higher than the other parameters in detecting clickbait. There was a steady increase in accuracy with the increase in the entries in database.

5.2 CONCLUSION

The emergence of YouTube as a platform for video streaming created a revolution in the internet era. Soon YouTube was crowned as the best Video Streaming Platform powered by Google. YouTube became so popular that each and every internet user trusted it. One of the reasons for its high demand of usage and its popularity is that it pays the content creators for the videos they create based on its insight, that is its view count and other video parameters. Since it's an easy source of income people started finding shortcuts without any effort of creating content, one of which is clickbaited videos.

The escalation of Clickbait videos in YouTube has created a sense of deceitfulness in public which might harm the honest contents. Clickbait Detection is imperative to maintain the reliability and quality of the platform. Like-Dislike ratio used to be the most effective feature in detecting clickbait in the past. But as dislike count got hidden, there came the necessity to rely on the other features of the video such as title, comments, like-view, category id etc. Research has been conducted to assess the performance of each feature and to determine the most effective one in detecting whether the video is a clickbait or not. This research thus defines a pathway to a reliable exploration of YouTube platform and thereby refining YouTube as a platform.

5.3 FUTURE WORK

Clickbait Detection is a project of infinite potential. With the content publishers finding new and creative ways of baiting viewers for income, we ought to find more ways and create stronger algorithm for its prevention. Some of the few planned future developments are:-

- Discovering new features to classify videos as clickbait or non-clickbait with an accuracy higher than the other features
- Increase the number of videos in the dataset.
- Use thumbnail for the detection of clickbait using image processing.
- Use comment depth analysis for better accuracy.
- Compare audio and text extracted from the video.
